Dear Hiring Team,

I build and ship production web applications that teams rely on. With over six years of full stack experience, I design and own features end to end, from architecture and API design through frontend implementation and cloud deployment. My focus is on scalable systems, maintainable code, and reliable delivery.

In my recent roles, I contributed to client-facing SaaS platforms operating in regulated and operationally critical environments. I built full stack features in React and TypeScript, designed RESTful APIs with Node and NestJS, optimized SQL queries, and supported applications in live production. I am comfortable diagnosing and resolving production issues, collaborating closely with product and QA, and ensuring the systems I deliver are stable and predictable.

I also build independently to sharpen my architectural thinking. Trivia Master, a Jeopardy-style trivia application I developed using React, TypeScript, and NestJS, reflects my approach: clear separation of concerns, server-enforced business logic, containerized development, and deployment to AWS infrastructure.

I value clear communication, thoughtful code reviews, and teams that take pride in the quality of what they ship. I would welcome the opportunity to bring that ownership mindset to your team and contribute to building reliable, scalable software.

Sincerely,

James McCarthy
